A COMPLETE INDEPENDENT LEARNING ROADMAP

SMART MONEY CONCEPTS

26-Lesson Free Study Workbook

Detailed learning steps | Clickable free resources | Chart drills | Eight-week calendar

26	8	44h 08m
ORIGINAL LESSONS	STUDY WEEKS	ORIGINAL VIDEO RUNTIME

WHO THIS IS FOR

A self-directed trader learning SMC / ICT-style technical analysis from first principles to a single rule-based, paper-tested entry model. The lesson names and video durations follow the supplied 26-class outline; all links in this workbook point to separate public learning materials.

HOW TO USE THIS GUIDE

01 Follow the weekly learning order, which intentionally differs from the paid class numbering.

02 Study the listed free source(s), then work through the numbered steps on the lesson page.

03 Perform the chart drill on historical data, save screenshots and answer the mastery check.

04 Do not move to real-money trading because you finished a course. Prove you can apply a defined, testable model first.

EDUCATIONAL USE ONLY | No method or chart label guarantees profitability. Leveraged trading can cause major losses.

Your eight-week study system

Pace: about 8-11 hours per week, six study days and one rest day. A typical lesson takes 45-75 minutes of public reading/video, 45-60 minutes of chart work, plus review. The 44h 08m figure is the sum of the original locked-video durations; it is not time you need to spend watching them.

DAILY WORKFLOW

01 READ / WATCH (30-45 min): study one primary free link and take notes in your own wording.

02 MARK (35-50 min): examine historical candles, labeling only what was knowable at that point.

03 REVIEW (15 min): screenshot valid examples, failed examples and one ambiguity.

04 RECALL (10 min): answer the mastery check without looking at your notes.

THE FOUR RULES THAT PREVENT HINDSIGHT LEARNING

Use one instrument and fixed chart timeframes for each test sample.

Do not move the swing/FVG/OB boundary after the outcome is known.

Include failed patterns, missing entries and no-trade days in the sample.

Learn the label first, but judge the strategy by rules, costs, sample size and paper results.

SUGGESTED JOURNAL FIELDS

Date • market • timezone • timeframe • HTF bias • structure • liquidity reference • setup version • trigger • entry • stop • target • gross R • fees/spread • net R • screenshot URL • rule followed? • lesson learned.

Eight-week learning calendar

Classes are reordered for learning dependency: swings and structure first, liquidity and price zones second, bias third, then strategy construction and model testing.

WEEK	LESSON ORDER & FOCUS	WEEKLY EVIDENCE
1	01 · 02 · 03 · 04 Foundation reading & swing discipline	30 structure/IDM examples; journal and chart workspace
2	05 · 10 · 14 Structure hierarchy and multi-timeframe	20 external/internal maps; 10 multi-timeframe examples
3	12 · 13 · 06 Liquidity and imbalance	20 sweeps/breakouts; 20 FVGs; 10 range maps
4	07 · 08 · 09 · 11 Advanced PD arrays and POIs	25 OB/POI case studies and a zone-quality rubric
5	15 · 16 · 17 Bias, time and dealing ranges	10 pre-session bias sheets and before/after screenshots
6	19 · 20 · 22 · 23 Confirmation models and time theory	MSS/CISD examples, CRT prerequisite notes and quarter maps
7	18 · 21 · 24 A minimal playbook + entry families	One-page strategy; 20 CRT observations; entry model shortlist
8	25 · 26 Advanced model audit & first backtest	20-30 blind historical scenarios; decide what to simulate next

WEEKLY CHECKPOINT: Did you finish the defined chart evidence and preserve the losing/non-fitting examples?

IF YOU HAVE ONLY 60 MINUTES A DAY

Spend Days 1-4 learning one subtopic each, Day 5 chart-marking, Day 6 reviewing and Day 7 resting. Extend this guide to 12-16 weeks rather than skipping exercises. For unfamiliar material, repeat a week before proceeding.

HOW TO READ THE LESSON PAGES

Each class sheet contains: (1) an explicit outcome, (2) a six-step study path, (3) a free resource set, (4) chart lab deliverables, (5) a mastery question and (6) the most common interpretation error. The checkboxes are for your own records.

Important concept and source notes

PUBLIC MATCHES VS. INSTRUCTOR-SPECIFIC NAMES

Most foundational topics (swings, BOS/CHoCH, liquidity, FVG, OB, daily bias, AMD, OTE and CRT) have accessible public explanations. Later lessons in the screenshot also contain labels such as TBS, TWS, AO-X, CiC, TCiC, PSB, MCS/WCS/DCS/SCS/MSCS and named "fixed" variations. Those are not all universally standardized. A public lesson is sometimes a related concept, not a copy of the paid instructor's exact technique. Where definitions are unclear, this workbook explicitly asks you to write the original rule before testing.

AN EXAMPLE OF A GOOD RULE

"On the 5-minute chart, after price takes the marked Asian low and a completed candle closes back above it, wait for a candle close above the last confirmed 5-minute lower high. If that displacement creates a bullish FVG, consider the first revisit only. Invalidate beyond the sweep low." This is concrete enough to test, though not a recommendation to trade.

AN EXAMPLE OF A BAD RULE

"Price will go to liquidity because smart money is manipulating retail traders." This cannot be tested as written, and the underlying participant intent is not visible on a price chart.

WHAT YOU WILL HAVE AFTER EIGHT WEEKS

A consistent chart-labeling rulebook for swings, IDM, liquidity and zones.

A set of before-and-after chart screenshots, including counterexamples.

A daily-bias worksheet and a ranked POI checklist.

A catalog of 20+ entry-model names, with each classified as defined, partially mapped or undefined.

A concise candidate strategy ready for blind backtesting and simulated forward observation.

RISK BEFORE SPEED

The goal is skill acquisition, not high-frequency activity. Avoid promises of fixed returns, sales claims about large win rates, and trading products you do not understand. Simulation removes money at risk, not all sources of behavioral bias; later real fills may differ.

CLASS 01 / WEEK 1 / START HERE

Orientation

Original class duration: 56m 07s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Set up a trading-learning environment and decide exactly what will be measured before studying patterns.

STUDY IN THIS ORDER

01 Identify the market you will study (for example one forex pair, index future, or cryptocurrency). Do not switch instruments during your first four weeks.

02 Learn candlestick OHLC, chart timeframes, order types, bid/ask spread, leverage and the distinction between chart analysis and execution.

03 Open a free chart workspace and a paper-trading account. Set the chart timezone explicitly and record it in your journal.

04 Create five standard chart templates: blank candlesticks, swing structure, liquidity levels, PD arrays and top-down analysis.

05 Define a screenshot-naming convention and an evidence log. Marking a chart is practice; a rule and outcome log is testing.

06 Write your initial risk policy: simulated trading only while learning, no borrowed money, no guaranteed-income expectations.

FREE RESOURCES • CLICK TO OPEN

› BabyPips - School of Pipsology

› TradingView - Paper Trading help

› Investor.gov - risks of day trading

CHART LAB / REQUIRED EVIDENCE

Save a clean chart and identify open, high, low and close on five candles.

Mark yesterday's high and low and label your chart timezone.

Create a journal with date, symbol, timeframe, setup, bias, stop, target, fees, result in R and screenshot.

MASTERY CHECK

Explain why a chart pattern alone does not establish an edge; demonstrate a simulated order with a stop.

WATCH FOR Avoid purchasing indicators or using real capital before you can define a setup.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 02 / WEEK 1 / FOUNDATIONS

Pullback Identification

Original class duration: 1h 40m 02s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Distinguish an ordinary retracement from a deeper structural reversal.

STUDY IN THIS ORDER

01 Define impulse, expansion, pullback, consolidation and reversal in your own words. Mark the dominant directional leg before labeling any correction.

02 On a bullish chart, identify the last impulsive move and its retracement. Note which prior swing is protected by the current structure.

03 Compare shallow, deep and overlapping pullbacks. A larger retracement is not automatically a trend reversal without structural evidence.

04 Observe whether the pullback reaches an FVG, prior support/resistance or another previously identified area, without assuming it must reverse there.

05 Create a rule for when a pullback has ended; compare a close above a minor high, a displacement candle and a higher-low confirmation.

06 Repeat on a downtrend and a sideways market. Identify three cases where an apparent pullback became a reversal.

FREE RESOURCES • CLICK TO OPEN

› TTrades - phases of price: retracements

› TTrades - basic market structure

› TTrades - relevant swing highs and lows

CHART LAB / REQUIRED EVIDENCE

Annotate 15 bullish and 15 bearish impulse/pullback sequences.

For five examples, freeze the chart before the next candle and predict only whether your rule is triggered.

Label the invalidation swing for each sequence.

MASTERY CHECK

Given a chart, explain which level would turn your pullback interpretation into a reversal hypothesis.

WATCH FOR Do not call every red candle in an uptrend a valid pullback.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 03 / WEEK 1 / FOUNDATIONS

Swing Identification

Original class duration: 1h 24m 21s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Mark objective swing highs/lows and build a consistent HH-HL-LH-LL sequence.

STUDY IN THIS ORDER

01 Start with a mechanical three-candle pivot rule: a swing high is above adjacent candle highs; a low is below adjacent lows.

02 Confirm that a pivot requires subsequent candles. Do not label the newest unconfirmed candle as a completed swing.

03 Connect significant pivots to identify HH/HL in an uptrend, LH/LL in a downtrend and the messy overlap of ranges.

04 Distinguish local internal pivots from external pivots that define the broader swing. Use identical rules in every screenshot.

05 Mark equal highs/lows separately; decide whether equal tolerance uses tick size or a stated price buffer.

06 Compare pivot structure on 1H and 15m and show how one 1H leg may contain several 15m swings.

FREE RESOURCES • CLICK TO OPEN

› TTrades - relevant swing highs and lows

› TTrades - basic market structure

› Penchan - STH / ITH / LTH structure guide

CHART LAB / REQUIRED EVIDENCE

Label 25 swings on one 1H chart and 25 on a 15m chart.

Circle five pivots that looked valid but had not yet been confirmed.

Save 10 HH-HL / LH-LL examples and five ranging counterexamples.

MASTERY CHECK

Can another student reproduce your swing marks using your written rule?

WATCH FOR Avoid choosing the most attractive swing retrospectively after knowing the result.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 04 / WEEK 1 / FOUNDATIONS

Inducement (IDM)

Original class duration: 1h 13m 05s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Differentiate a proposed inducement swing from a normal HL/LH using explicit criteria.

STUDY IN THIS ORDER

01 Write the IDM definition used by your chosen SMC source. Teachers disagree on whether inducement is a minor swing, a liquidity lure or a mandatory pre-BOS level.

02 Draw the current external high/low and the smaller internal swings leading into a prospective larger objective.

03 Mark which small lows/highs could plausibly contain protective stops and which levels are merely ordinary noise.

04 Compare two case types: a minor swing being swept before continuation, and a minor swing breaking without a meaningful reversal.

05 Set a rule that IDM is not a guaranteed sweep; avoid relabeling every failed setup as inducement after the move.

06 Revisit your earlier chart markings and classify each disputed IDM point as confirmed under your rule, uncertain or invalid.

FREE RESOURCES • CLICK TO OPEN

› The Right Trader - inducement (IDM)

› TTrades - basic market structure

› TTrades - buy-side and sell-side liquidity

CHART LAB / REQUIRED EVIDENCE

Collect 20 potential IDM situations; record 10 clear and 10 ambiguous examples.

Mark the level, the intended external target and the invalidation point.

Write a one-sentence reason why each proposed IDM is not simply an HL/LH.

MASTERY CHECK

When is a higher low a structural HL but not necessarily IDM? Defend the distinction in one chart.

WATCH FOR An IDM label is an interpretation of visible price action, not proof that institutions engineered a trap.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 05 / WEEK 2 / STRUCTURE

Advanced Market Structure

Original class duration: 2h 14m 26s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Integrate internal/external swings, BOS, CHoCH, protected highs/lows and displacement.

STUDY IN THIS ORDER

01 Map the current external range, the last confirmed external break and the internal moves contained within it.

02 Define a continuation BOS and a countertrend CHoCH/MSS. Choose whether your system requires a candle body close beyond a specific swing.

03 Identify protected versus vulnerable structural levels. Explain what price must do to invalidate the current directional read.

04 Separate a weak wick penetration from a decisive break with displacement. Record why some apparent breaks fail.

05 Walk forward candle by candle and update structure without moving yesterday's labels to fit the final outcome.

06 Write rules for conflict resolution: e.g. bearish 5m internal CHoCH inside a bullish 1H external leg.

FREE RESOURCES • CLICK TO OPEN

› TTrades - advanced market structure

› TTrades - basic market structure

› TTrades - MSS vs. CISD explained

CHART LAB / REQUIRED EVIDENCE

Draw 10 full bullish and 10 full bearish structure maps with BOS/CHoCH labels.

Write the protected level and invalidation rule on each map.

Annotate five examples where internal and external bias disagree.

MASTERY CHECK

Explain why a lower-timeframe CHoCH may remain just a higher-timeframe pullback.

WATCH FOR Differentiate a wick sweep from a closed structural break in your definitions.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 06 / WEEK 3 / LIQUIDITY & PD ARRAYS

FVG, iFVG, Order Block and Imbalance

Original class duration: 1h 27m 08s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Identify three-candle imbalances and compare them with order blocks and inverse FVGs.

STUDY IN THIS ORDER

01 For a bullish three-candle FVG, check that candle 3 low is above candle 1 high; reverse the inequality for bearish gaps.

02 Mark the exact gap boundaries and the midpoint (consequent encroachment). Record whether the gap appears after displacement.

03 Distinguish a simple imbalance, a traded-through or filled gap, and an inversion FVG in which the former gap loses its original role.

04 Locate the last opposing candle before a clear directional expansion as an order-block candidate. Identify its body, wick and midpoint.

05 Compare five FVGs that align with higher-timeframe direction against five that form randomly mid-range.

06 Write an invalidation and retest rule for each zone rather than assuming every FVG or OB must be respected.

FREE RESOURCES • CLICK TO OPEN

› TTrades - understanding fair value gaps

› TTrades - inversion fair value gaps

› TTrades - order blocks simplified

CHART LAB / REQUIRED EVIDENCE

Mark 20 FVGs (10 bullish/10 bearish) and note their fill/inversion outcomes.

Mark 10 OB candidates and distinguish each from nearby FVGs.

Save five counterexamples where an attractive zone failed.

MASTERY CHECK

Can you identify the three candles creating an FVG without using an indicator?

WATCH FOR Not all gaps fill, and a gap or OB is not evidence of the exact underlying institutional orders.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 07 / WEEK 4 / ADVANCED POIS

Advanced Order Block

Original class duration: 1h 16m 03s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Build reproducible OB selection and grading rules, including failed candidates.

STUDY IN THIS ORDER

01 Restate the basic bullish/bearish OB definition, then specify what counts as meaningful displacement or structural confirmation.

02 Separate a fresh OB from a previously mitigated or deeply retested zone; write a consistent rule for first and repeated touches.

03 Compare full-wick, full-body and midpoint refinements. Never change the boundary method midway through a backtest.

04 Grade OB context: external bias, liquidity event, position in premium/discount and proximity to opposing liquidity.

05 Observe whether a revisit gives clean rejection, partial mitigation, immediate invalidation or no revisit at all.

06 Create an OB quality rubric with three mandatory factors and three optional factors; record which ones actually improve results.

FREE RESOURCES • CLICK TO OPEN

› TTrades - order blocks simplified

› TTrades - order blocks for continuations

› TTrades - points of interest that matter

CHART LAB / REQUIRED EVIDENCE

Collect 20 OBs: 10 that reacted and 10 that failed or were never revisited.

Mark exact zone boundaries and one objective invalidation per example.

Compare the same OB on 1H versus 5m before drawing conclusions.

MASTERY CHECK

How would you distinguish an OB from any arbitrary last bearish/bullish candle?

WATCH FOR Avoid calling only successful hindsight levels "valid" after the fact.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 08 / WEEK 4 / ADVANCED POIS

Rejection Block, Breaker Block and Unicorn Model

Original class duration: 1h 06m 46s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Differentiate a wick-based rejection area, a failed OB acting as breaker, and a breaker-FVG overlap.

STUDY IN THIS ORDER

01 Study rejection blocks as a wick-centered candidate zone; record the source's exact rules because naming and boundaries vary.

02 Identify a previously qualified OB that has been violated and later tested from the other side: a breaker-block hypothesis.

03 Map the directional structure shift or liquidity event that gives the breaker a plausible context.

04 Find the overlap between a breaker block and an FVG. That confluence is often taught as a Unicorn model.

05 Document one entry trigger, invalidation rule and target for each pattern; do not trade merely because two boxes overlap.

06 Compare positive and negative samples to test whether confluence filters reduce false signals.

FREE RESOURCES • CLICK TO OPEN

› TTrades - breaker blocks simplified

› TTrades - unicorn entry model

› TTrades - free advanced-concepts library

CHART LAB / REQUIRED EVIDENCE

Draw 10 breaker setups, 5 wick rejection zones and 10 breaker/FVG overlaps.

For each, identify the original OB, the failure/violation, and the revisit.

Explain five cases where a claimed Unicorn overlap never produced a controlled entry.

MASTERY CHECK

What must happen before an ordinary OB becomes a breaker in your rules?

WATCH FOR The rejection-block name and some Unicorn refinements are educator-dependent.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 09 / WEEK 4 / ADVANCED POIS

Mitigation Block, Reclaimed Block and QML

Original class duration: 1h 28m 49s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Compare block re-use/reaction concepts with the Quasimodo reversal pattern.

STUDY IN THIS ORDER

01 Read one consistent mitigation-block definition and identify the swing and retracement behavior the source requires.

02 For a reclaimed OB, separate the descriptive idea (a level regained after being lost) from any instructor-specific formal rule.

03 Learn the bearish QML sequence: high, higher high, structural low break, then retest toward the left-shoulder area; mirror for bullish.

04 Explain how QML differs from a simple double top/bottom or an unconfirmed head-and-shoulders.

05 Choose a fixed zone-placement method for each pattern; explicitly flag cases in which boundaries are subjective.

06 Use only demo/historical charts until you have an independent definition that produces repeatable marks.

FREE RESOURCES • CLICK TO OPEN

› TTrades - mitigation blocks simplified

› Qazi Forex Tips - Quasimodo pattern (Hindi/Urdu video)

› TTrades - free advanced-concepts library

CHART LAB / REQUIRED EVIDENCE

Mark 10 QML candidates and 10 mitigation/reclaimed candidates.

Write a four-event sequence next to every QML rather than drawing only a line.

Save five cases where a retest never occurs or the presumed reversal fails.

MASTERY CHECK

Name the structural sequence that qualifies a bearish QML.

WATCH FOR Reclaimed-block definitions differ widely: treat a free lesson as a related concept, not the paid instructor's exact method.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 10 / WEEK 2 / STRUCTURE

STL, STH, ITL and ITH Mapping

Original class duration: 2h 01m 04s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Rank short-term and intermediate-term pivots and understand their nesting.

STUDY IN THIS ORDER

01 Use a three-candle pivot to mark short-term highs (STH) and short-term lows (STL). The right-side candle must be complete.

02 Grade an intermediate-term high (ITH) when a short-term high exceeds the adjacent short-term highs; reverse for ITL.

03 Extend the hierarchy to long-term highs/lows (LTH/LTL) as context, even though the lesson title stops at intermediate-term.

04 Show how high/low hierarchy relates to external liquidity and structural targets, while avoiding automatic importance claims.

05 Compare one 1H chart with its 15m chart. Explain why a 15m ITH need not be a 1H ITH.

06 Build a consistent labeling/color scheme for all six swing ranks and preserve the scheme across future sessions.

FREE RESOURCES • CLICK TO OPEN

› Penchan - STH / ITH / LTH structure guide

› TTrades - advanced market structure

› TTrades - relevant swing highs and lows

CHART LAB / REQUIRED EVIDENCE

Grade at least 50 local pivots into STL/STH/ITL/ITH where applicable.

Screenshot five nested examples in which an ITH comprises several STHs.

Record five unconfirmed candidates to expose lookahead bias.

MASTERY CHECK

Why can the latest swing not be classified as a completed three-candle pivot immediately?

WATCH FOR Never confuse "intermediate-term" with a fixed candle count or a particular timeframe.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 11 / WEEK 4 / ADVANCED POIS

Structure-Based Point of Interest (POI)

Original class duration: 2h 25m 19s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Select candidate reaction zones using the structural story rather than arbitrary rectangles.

STUDY IN THIS ORDER

01 First identify the current external range, structural direction, recent break and nearby opposing liquidity.

02 Only then locate potential POIs: OB, FVG, breaker, prior swing, supply/demand zone or balanced price range.

03 Score each candidate by structure alignment, clarity of origin, displacement, untouched status and distance to the objective.

04 Distinguish "zone touched" from "entry signaled". Require a separate trigger if your model needs confirmation.

05 Record whether the POI is above/below equilibrium in the current dealing range, and whether another higher-timeframe zone conflicts.

06 Use a pass/no-pass rubric to reduce choice overload when three zones appear near one another.

FREE RESOURCES • CLICK TO OPEN

› TTrades - points of interest that matter

› TTrades - internal / external range liquidity

› TTrades - understanding dealing ranges

CHART LAB / REQUIRED EVIDENCE

For 15 historical swings, rank no more than two POIs before viewing the outcome.

Record the chosen zone and one deliberately rejected zone with reasons.

Compare the hit rate and quality of first versus repeated revisits.

MASTERY CHECK

Explain why a zone is contextually relevant before describing the candle that formed it.

WATCH FOR A POI is a watchlist area, not a guaranteed reversal location.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 12 / WEEK 3 / LIQUIDITY & PD ARRAYS

Liquidity: External, Internal, Grab and Sweep

Original class duration: 1h 40m 40s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Map visible liquidity references and distinguish sweep, breakout and larger external liquidity events.

STUDY IN THIS ORDER

01 Define buy-side liquidity (above highs) and sell-side liquidity (below lows) as hypotheses about where stops may cluster.

02 Identify external-range levels (important prior highs/lows) and internal-range levels (minor pivots and imbalances inside the range).

03 Mark previous day high/low, session high/low and equal high/low levels before moving to lower timeframes.

04 Distinguish a wick through a level with close back inside (sweep candidate) from price accepting beyond it (possible breakout).

05 Define "grab" versus "sweep" for your own journal; the industry does not have one universal boundary.

06 Track what price does after the event; avoid automatically interpreting every break as manipulation.

FREE RESOURCES • CLICK TO OPEN

› TTrades - buy-side and sell-side liquidity

› TTrades - previous day high/low liquidity

› TTrades - internal / external range liquidity

CHART LAB / REQUIRED EVIDENCE

Mark BSL and SSL on 20 charts before the later candles are revealed.

Collect 10 sweeps and 10 sustained breakouts using one close-back rule.

Write the next visible target, or "no clear target", on each sample.

MASTERY CHECK

How do you tell a sweep hypothesis from a confirmed structural breakout in real time?

WATCH FOR A price chart does not show the actual placement or ownership of unseen stop orders.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 13 / WEEK 3 / LIQUIDITY & PD ARRAYS

Liquidity Pool, Void, Supply/Demand and Premium/Discount

Original class duration: 1h 31m 19s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Combine clusters of reference levels, low-activity zones and position within a dealing range.

STUDY IN THIS ORDER

01 Mark equal highs/lows and repeated swing extremes as visible liquidity pools, not guaranteed stop concentrations.

02 Differentiate an FVG from a broader liquidity void or rapid price run; write the boundary method you choose.

03 Study basic supply/demand zones as areas preceding directional moves, then compare those zones with OB definitions.

04 Define a dealing range using two chosen structural extremes. Split the range at its 50% equilibrium (EQ).

05 Label premium above EQ and discount below EQ. Explain that these are relative prices, not automatic buy/sell signals.

06 Combine a liquidity draw, zone and premium/discount context into a directional scenario with an explicit invalidation.

FREE RESOURCES • CLICK TO OPEN

› TTrades - premium, discount and equilibrium

› TTrades - understanding dealing ranges

› Zonetta - free supply-and-demand lessons

CHART LAB / REQUIRED EVIDENCE

Mark 15 liquidity pools and 10 displacement voids.

Draw 10 dealing ranges with EQ, premium and discount zones.

Compare supply/demand boxes with OB candidates in five examples.

MASTERY CHECK

Why do premium/discount labels change when the reference range changes?

WATCH FOR Do not claim a zone is "institutional" without evidence beyond price behavior.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 14 / WEEK 2 / STRUCTURE

Fractal Nature of Price

Original class duration: 1h 56m 03s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Understand how swings, ranges and structural shifts nest across timeframes.

STUDY IN THIS ORDER

01 Compare a single 4H candle to its constituent 1H and 15m candles; note that the same high/low can contain many internal events.

02 Create a top-down map: Daily = broad context, 1H = intermediate structure, 5m/15m = execution detail.

03 Identify a lower-timeframe CHoCH that did not invalidate the higher-timeframe trend.

04 Explain how opposing ranges can coexist and why a small-timeframe FVG may conflict with a large-timeframe liquidity draw.

05 Design two timeframe pairings appropriate to your market; avoid changing them after the trade works or fails.

06 Practice eliminating irrelevant lower-timeframe noise while retaining exact entry timing for your chosen model.

FREE RESOURCES • CLICK TO OPEN

› TTrades - fractal top-down playbook

› TTrades - multiple-timeframe top-down analysis

› TTrades - advanced market structure

CHART LAB / REQUIRED EVIDENCE

Produce 10 three-timeframe annotated case studies.

Label the dominant bias and internal pullback for each timeframe.

Save five examples of lower-timeframe reversal within higher-timeframe continuation.

MASTERY CHECK

Can you explain the same price move as a 5m reversal and a 1H pullback?

WATCH FOR Fractality describes nesting; it does not mean identical trading accuracy at every timeframe.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 15 / WEEK 5 / BIAS & TIMING

Advanced Bias, Part 1: Daily Bias

Original class duration: 1h 25m 51s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Write a directional scenario before a session and record when it becomes invalid.

STUDY IN THIS ORDER

01 Start with daily/4H highs and lows, recent closes, and larger visible liquidity references.

02 Identify the most plausible near-term liquidity objective, then state bullish, bearish or neutral - a neutral day is allowed.

03 Locate current price relative to the relevant dealing range, previous-day high/low and opening levels.

04 Write exactly which price condition would change the bias rather than defending one-sided predictions all day.

05 Compare a trend-continuation day, reversal day and consolidation day; avoid assuming every day offers an obvious direction.

06 Record the bias before viewing the later session, then review outcome and uncertainty without altering the original note.

FREE RESOURCES • CLICK TO OPEN

› TTrades - easy daily bias framework

› TTrades - previous day high/low liquidity

› TTrades - invalidation of daily bias

CHART LAB / REQUIRED EVIDENCE

Prepare pre-session daily-bias notes for 10 historical sessions.

For each note record direction, liquidity target, invalidation and confidence (low/medium/high).

Score direction and target independently at the end of each day.

MASTERY CHECK

What evidence would make you mark the day as neutral or invalidate a bullish scenario?

WATCH FOR Daily bias is a testable forecast, not proof that the market must reach a stated liquidity pool.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 16 / WEEK 5 / BIAS & TIMING

Advanced Bias, Part 2: Time/Price Theory and Dealing Range

Original class duration: 1h 44m 36s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Add time-of-day and range context without confusing timing windows with trade signals.

STUDY IN THIS ORDER

01 Define a relevant dealing range and its equilibrium; explicitly state which two highs/lows you used.

02 Mark previous-day and session OHLC levels, Asian range, London/NY references and scheduled market openings.

03 Read about kill zones and observe volatility differences by hour in your instrument. Convert times using New York timezone and daylight saving.

04 Study premium/discount and expected draw on liquidity as separate conditions: both can disagree.

05 Record news and holiday effects and whether a time window contained a clear setup, a fake move or no signal.

06 Create a time-price checklist with range, bias, session, liquidity reference, confirmation and invalidation.

FREE RESOURCES • CLICK TO OPEN

› TTrades - understanding dealing ranges

› TTrades - important OHLC time levels

› TTrades - trading session kill zones

CHART LAB / REQUIRED EVIDENCE

Prepare time-and-price maps for 10 historical days.

Document at least five no-trade windows despite having a directional bias.

Label equivalent Bangladesh clock times for your chosen session dates (DST matters).

MASTERY CHECK

Why is "London open" not always the same fixed Dhaka clock time?

WATCH FOR Quarter hours, kill zones and opening prices should be treated as contextual hypotheses, not deterministic schedules.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 17 / WEEK 5 / BIAS & TIMING

Applying Advanced Bias on a Chart

Original class duration: 2h 02m 53s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Perform a reproducible daily-to-intraday analysis before a simulated session.

STUDY IN THIS ORDER

01 Begin with a blank daily chart; mark previous day high/low, major swing, dealing range and likely external target.

02 Write the day's bullish, bearish or neutral bias and the exact price level that would invalidate it.

03 Move to the 1H chart to identify structure, relevant POIs, recent liquidity events and current phase.

04 Move to 15m/5m only to define entry conditions. Do not let lower-timeframe noise reverse a well-defined HTF plan without a rule.

05 Define the no-trade conditions: conflicting structure, major news, insufficient target room, unclear stop or late entry.

06 Save the pre-session screenshot and compare it with the end-of-session screenshot with no retrospective redraw.

FREE RESOURCES • CLICK TO OPEN

› TTrades - fractal top-down playbook

› TTrades - multiple-timeframe top-down analysis

› TTrades - easy daily bias framework

CHART LAB / REQUIRED EVIDENCE

Complete 10 full top-down markups using one instrument.

Keep two screenshots per session: before and after.

Record whether bias was correct, whether an entry existed and whether the plan was followed.

MASTERY CHECK

Can another trader understand your thesis, trigger and invalidation from one pre-session page?

WATCH FOR Do not revise the pre-session thesis to make hindsight appear accurate.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 18 / WEEK 7 / STRATEGY BUILDING

Personal Trading Strategy

Original class duration: 1h 44m 47s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Write one complete, falsifiable setup with risk and performance metrics.

STUDY IN THIS ORDER

01 Choose one market, one session and one setup family (for example liquidity sweep + MSS + FVG); decline to combine 20 models.

02 Specify every precondition: bias timeframe, liquidity marker, confirmation timeframe, entry trigger, invalidation and target.

03 Define no-trade rules for spread/slippage, news, missing displacement, weak risk/reward or late session timing.

04 Set simulated position sizing based on predetermined risk per trade and hard session/week stop limits.

05 Choose backtest sampling rules that prevent selecting only winning charts; include realistic costs and missed fills.

06 Write performance metrics: sample size, expectancy in R, win rate, average win/loss, drawdown and rule adherence.

FREE RESOURCES • CLICK TO OPEN

› TTrades - a simple three-step trading model

› TTrades - how to backtest, step by step

› Investor.gov - risks of day trading

CHART LAB / REQUIRED EVIDENCE

Write your strategy on one page using exactly reproducible conditions.

Test five potential examples with a classmate or a second marking pass; check whether labels agree.

Prepare a blank trade journal and an error classification sheet.

MASTERY CHECK

Can a stranger follow your rules without asking which FVG or swing you meant?

WATCH FOR A strategy story is not an edge until it survives out-of-sample and forward simulation.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 19 / WEEK 6 / CONFIRMATION MODELS

MSS, CISD, TBS and TWS

Original class duration: 1h 50m 27s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Distinguish two documented confirmation ideas and formally define the course-specific labels.

STUDY IN THIS ORDER

01 Review market structure shift (MSS): a relevant opposing structural break, often associated with displacement.

02 Study change in state of delivery (CISD) using the chosen free source; note that it may use candle sequences rather than the same pivot as MSS.

03 Annotate how MSS and CISD can occur in different candles or disagree on timing within the same reversal.

04 Treat TBS and TWS as instructor-dependent abbreviations. Do not invent their full forms or entry rules without the original explanation.

05 Create a provisional glossary: for each undefined term, record exact trigger candle, required context and failure condition once verified.

06 Compare a confirmed shift, an unconfirmed stop-run and a continuation on at least one timeframe.

FREE RESOURCES • CLICK TO OPEN

› TTrades - MSS vs. CISD explained

› TTrades - understanding CISD

› ICT Flow - structured free ICT / SMC modules

CHART LAB / REQUIRED EVIDENCE

Mark 15 MSS examples and 15 CISD examples, including non-matches.

Build a two-column chart explaining why each event did/did not meet both definitions.

Add a "needs source definition" note for TBS/TWS rather than guessing.

MASTERY CHECK

What is the earliest bar that meets your written MSS rule? Is it the same bar as CISD?

WATCH FOR TBS/TWS have no reliably established universal expansion in this syllabus.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 20 / WEEK 6 / CONFIRMATION MODELS

AMD and Judas Swing

Original class duration: 1h 25m 07s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Study accumulation/manipulation/distribution as a scenario and a timed false-open reversal hypothesis.

STUDY IN THIS ORDER

01 Read the Power of Three (PO3/AMD) narrative: initial range, excursion beyond reference levels, then directional expansion.

02 Define accumulation by observable range properties rather than after-the-fact claims about market participant intentions.

03 Mark Asian session range and a daily opening price; understand that exact session conventions depend on the market.

04 Study a Judas Swing as an early-session move through a visible level that subsequently reverses, not just any losing breakout.

05 Write rules for both a successful reversal and the alternate case where price keeps expanding in the original direction.

06 Use actual historical days to test whether the AMD classification was possible before the later expansion.

FREE RESOURCES • CLICK TO OPEN

› TTrades - Power of Three (AMD)

› The Right Trader - Judas Swing

› TTrades - trading session kill zones

CHART LAB / REQUIRED EVIDENCE

Track 12 historical days, classifying range, sweep, continuation and non-fitting days.

For eight suspected Judas Swings, mark the opening price, swept level and recovery close.

Count the days that never formed a clean AMD narrative.

MASTERY CHECK

What observable event prevents you from calling a breakout a confirmed Judas Swing prematurely?

WATCH FOR AMD is an interpretive framework, not proof of manipulation by identified institutions.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 21 / WEEK 7 / STRATEGY BUILDING

CRT + TBS Entry Technique

Original class duration: 1h 10m 46s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Test a Candle Range Theory sequence while leaving TBS rules explicitly provisional.

STUDY IN THIS ORDER

01 Study the CRT idea: a meaningful anchor candle defines a high-low range for subsequent price action.

02 Define a sweep beyond the anchor high/low and a close back inside the range; distinguish this from a sustained breakout.

03 Add optional lower-timeframe MSS/FVG confirmation only if you define it in advance; note changes in missed signals.

04 Measure the distance from entry to structural invalidation and to the opposing part of the anchor range.

05 Treat "TBS" as a course-specific add-on until its explicit trigger and invalidation are known.

06 Test the stand-alone CRT framework before attributing any improvement to the extra TBS condition.

FREE RESOURCES • CLICK TO OPEN

› CRT Trading - free Candle Range Theory guide

› Candle Range Theory - free tutorial

› TTrades - MSS vs. CISD explained

CHART LAB / REQUIRED EVIDENCE

Mark 20 CRT candidates on 1H/4H plus a lower timeframe.

Separate 10 close-back-inside cases from 10 breakout/failed-reclaim cases.

Write how you would test TBS once the original instructor's rule is obtained.

MASTERY CHECK

What close proves a sweep returned inside the anchor range in your CRT rule?

WATCH FOR CRT variants and timing anchors differ by educator; do not borrow win-rate claims.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 22 / WEEK 6 / CONFIRMATION MODELS

Fibonacci Tool: SD, AO-X, P&D and OTE

Original class duration: 1h 40m 36s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Use one consistent swing anchor for retracements and projections without claiming universal magic levels.

STUDY IN THIS ORDER

01 Review Fibonacci retracement drawing from a defined swing low to swing high (and reverse for bearish ranges).

02 Mark equilibrium (50%) and the commonly taught OTE retracement band of roughly 62%-79% on historical examples.

03 Compare retracement zones with the broader premium/discount halves of the dealing range.

04 Study standard-deviation price projections as one possible reading of "SD", but do not assume that this is the instructor's expansion.

05 Record "AO-X" as undefined/course-specific until its level rules and anchor are verified. Do not invent a tool or method.

06 Audit outcome sensitivity: moving the anchor swing changes every retracement ratio, so lock the anchor selection rule before backtesting.

FREE RESOURCES • CLICK TO OPEN

› TTrades - Optimal Trade Entry (OTE)

› TTrades - standard deviation projections

› TTrades - premium, discount and equilibrium

CHART LAB / REQUIRED EVIDENCE

Draw 15 retracements, with anchors shown and premium/discount labeled.

Record five examples where an OTE retracement was reached but no confirmation appeared.

Compare five projection-based targets with visible external liquidity objectives.

MASTERY CHECK

Which two points anchor your Fibonacci tool, and why were they known at that time?

WATCH FOR OTE levels are descriptive price zones; they do not independently predict reversals.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 23 / WEEK 6 / CONFIRMATION MODELS

Quarterly Theory

Original class duration: 1h 52m 50s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Learn four-part time segmentation and test it as a context filter, not a forecasting law.

STUDY IN THIS ORDER

01 Read quarterly theory (often associated with Daye): divide a selected year/month/week/day/session cycle into four quarters.

02 Understand the AMDX labels - accumulation, manipulation, distribution, continuation/reversal - as a proposed classification.

03 Write the calendar and session anchor conventions before charting; different resources disagree on some "true open" details.

04 Mark New York midnight, relevant quarter boundaries and the day's liquidity references on five sample days.

05 Compare quarter timing with actual volatility/expansion without relabeling phases to fit outcome.

06 Track nonconforming days and daylight-saving changes; treat timing claims as hypotheses requiring market-specific tests.

FREE RESOURCES • CLICK TO OPEN

› Quantum Algo - Quarterly Theory guide

› LiquidityPro - Daye Quarterly Theory

› TTrades - important OHLC time levels

CHART LAB / REQUIRED EVIDENCE

Prepare a quarter timeline for 10 days on your chosen instrument.

Before replaying each session, annotate the quarter and expected scenario.

Count days that follow, partly follow or contradict your written phase rules.

MASTERY CHECK

Can the model be falsified on a day when expansion happens in a different quarter?

WATCH FOR Quarterly theory has no broadly established independent evidence of a universal four-phase edge.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 24 / WEEK 7 / ENTRY MODEL LAB

All Advanced Entry Modules - Part 1

Original class duration: 1h 56m 49s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Catalog straightforward structure, POI and liquidity entries before exploring variants.

STUDY IN THIS ORDER

01 Start the entry-model library with three families: structure-based entry, POI-based entry and liquidity-sweep/reclaim entry.

02 Add common variants from the screenshot: Silver Bullet, SMT fill, accumulation-block and PSB labels, noting which terms are source-specific.

03 For each family, define a directional filter, setup sequence, trigger bar, invalidation, target and expiry condition.

04 Choose only one family for a baseline backtest. Others remain observation categories, not simultaneous signals.

05 Avoid comparing a one-minute scalp with an hourly swing setup without normalizing holding time, costs and session.

06 Use "not mapped to a public definition" rather than making up course-specific entry rules.

FREE RESOURCES • CLICK TO OPEN

› TTrades - a simple three-step trading model

› TTrades - AM Silver Bullet on NQ

› ICT Flow - structured free ICT / SMC modules

CHART LAB / REQUIRED EVIDENCE

Complete six entry-model cards with five required fields each.

Save five examples for each of the three baseline families.

Choose one model whose rules can be marked without hindsight.

MASTERY CHECK

What qualifies your chosen entry before the target is known?

WATCH FOR Multiple confirmations can be correlated versions of the same event rather than independent evidence.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 25 / WEEK 8 / ENTRY MODEL LAB

All Advanced Entry Modules - Part 2

Original class duration: 2h 06m 47s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Compare confirmation and timing-oriented entry families while controlling rule complexity.

STUDY IN THIS ORDER

01 Create catalog cards for engulfing entries, MCS/WCS/DCS/SCS/MSCS, back-to-back key-level entries and OC/BPR entries.

02 Add session + CiC + QT, iFVG/rejection entries and advanced killzone entries as separate hypotheses.

03 Mark which components have independently accessible public education and which require the paid instructor's precise definition.

04 Avoid expanding ambiguous abbreviations (CiC, MCS, BPR variants) unless you can cite the original source's wording.

05 For each candidate, grade observability: can you know the setup in real time, and can two people agree on the trigger?

06 Reduce the shortlist to at most two models. Prefer fewer variables and the clearest invalidation.

FREE RESOURCES • CLICK TO OPEN

› TTrades - how to trade inversion FVGs

› TTrades - trading session kill zones

› TTrades - how to backtest, step by step

CHART LAB / REQUIRED EVIDENCE

Build eight entry-model cards and tag ambiguous rules.

Use 10 blind historical examples to compare rule consistency across two models.

Discard any model that needs retrospective adjustment to call a signal valid.

MASTERY CHECK

Which specific entry-model labels cannot be implemented from public sources without guessing?

WATCH FOR A model with many exceptions may fit past charts while failing in forward simulation.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

CLASS 26 / WEEK 8 / ENTRY MODEL LAB

All Advanced Entry Modules - Part 3

Original class duration: 2h 45m 36s • Self-study: 45-75 min learning + 45-60 min chart lab

LEARNING OUTCOME

Finalize one testable playbook and begin a structured simulated performance sample.

STUDY IN THIS ORDER

01 Complete the remaining screenshot labels: Fixed TCiC, 2s CiC, Fixed QT Relation, Liquidity Purge and Liquidity Pool entries.

02 Write a source-status note for each unusual term. If it is instructor-specific, treat the matching public concept as only an approximation.

03 Choose a final model using five criteria: clarity, repeatability, market fit, realistic stops and sufficient opportunities.

04 Specify stop placement, target logic, estimated costs, maximum simultaneous exposure and a daily stop condition.

05 Design a blind historical test and a separate simulated forward test; do not change rules during either sample.

06 Evaluate the system using expectancy, drawdown, missed signals, false positives and checklist adherence, then revise only between samples.

FREE RESOURCES • CLICK TO OPEN

› TTrades - how to backtest, step by step

› TradingView - Paper Trading help

› CME Group - free trading simulator FAQ

CHART LAB / REQUIRED EVIDENCE

Finalize a one-page trading playbook and 20-30 historical entries.

Begin a separate 4-week paper-trading log; retain losing and missed examples.

Complete a post-test review: continue, refine once, or abandon the setup.

MASTERY CHECK

Can you state all model conditions in fewer than eight unambiguous rules?

WATCH FOR Neither finishing the 26 classes nor finding a high historical win rate justifies live leveraged trading.

STATUS: ☐ Resource studied ☐ Notes made ☐ Chart lab saved ☐ Mastery question answered

Appendix A / Entry-model catalog

The screenshots promise more than 20 entry techniques. Use this catalog to organize them; it is a naming inventory, not 20 proven trading strategies. A label without a precise public definition is marked "verify instructor".

MODEL / FAMILY	LEARNING NOTE	CLASS
Structure-based entry	Structure confirmation first	24
POI-based entry	Zone selected before execution	24
Liquidity-based entry	Sweep/reclaim or liquidity target	24
CRT + TBS entry	CRT public; TBS verify instructor	21
Silver Bullet	Public ICT-style timed FVG model	24
SMT Fill entry	SMT has public variants; exact fill rule verify	24
Accumulation Block (Accu Block)	Verify exact block/trigger definition	24
PSB entry	Verify instructor-specific acronym	24
Engulfing entry	Public price action; exact advanced variants verify	25
MCS/WCS/DCS/SCS/MSCS	Verify exact expansions and conditions	25
B2B key-level entry	Verify back-to-back rule and trigger	25
OC / BPR entry	BPR partly public; verify OC and exact rule	25
Session + CiC + QT	QT public; CiC verify instructor	25
iFVG / rejection entry	iFVG public; rejection confirmation varies	25
Killzone entries (advanced)	Public time windows; exact setup varies	25
Fixed TCiC entry	Verify the exact TCiC definition	26
2s CiC entry	Verify the exact 2s/CiC definition	26
Fixed QT relation entry	Quarterly concept public; variation verify	26
Liquidity purge entry	Related to sweeps; exact entry rule verify	26
Liquidity pool entry	Public pools; exact trigger/exit verify	26

Implementation rule: do not trade an entry model until its triggers, invalidation and time constraints can be written in a short checklist.

Appendix B / Reusable worksheets

PRE-SESSION DAILY BIAS SHEET

Date / market / chart timezone: _____

Daily and 4H structure: _____

External BSL and SSL: _____

Dealing range high / low / EQ: _____

Planned bias (bull / bear / neutral): _____

Objective / invalidation / scheduled news: _____

No-trade conditions: _____

ONE-SETUP ENTRY CARD

Setup name / version / market: _____

Directional filter: _____

Required liquidity event: _____

Confirmation candle / displacement rule: _____

Permitted POI / entry zone: _____

Entry trigger / expiry: _____

Stop / target / risk definition: _____

Costs and no-trade conditions: _____

Appendix C / Testing and review

SIMPLE TESTING PROTOCOL

01 Freeze the rules. Version the entry model (v1.0) before collecting cases.

02 Choose a historical date range before viewing the outcomes; use one instrument and one chart feed.

03 Record every eligible signal and every rule-based no-trade, not just winning examples.

04 Calculate gross R, then subtract spread, commissions and estimated slippage for net R.

05 Evaluate at least 50-100 historical setups if sufficient examples exist; small samples are highly uncertain.

06 Keep a later time period for out-of-sample checking; do not optimize settings using that period.

07 Forward-test with paper trading, retaining all fills, missed fills and discretionary overrides.

08 Make at most one well-defined rule change after a review, then re-test as a new version.

METRICS TO WRITE IN YOUR JOURNAL

Win rate = wins / total completed trades.

Average winner / loser = average positive / absolute negative result, in R.

Expectancy (R per trade) = win rate × average winning R − loss rate × average losing R − average costs in R.

Drawdown = peak-to-trough decline in the cumulative results curve.

Rule adherence = trades following the written checklist / all sampled trades.

FOUR-WEEK PAPER-TRADING PHASE AFTER THE COURSE

Week A: 10-15 simulated observations, verifying marking consistency. Week B: run the unchanged playbook and capture actual fills. Week C: continue without midweek rule edits, including skipped/no-trade sessions. Week D: evaluate net expectancy, drawdown, adherence and mistakes. If evidence is unclear, continue observing instead of scaling risk.

END-OF-WEEK REVIEW QUESTIONS

What did I label incorrectly? Which rules created conflicting signals? Which entry conditions were observable in real time? How many attractive but invalid setups did I skip? What will I keep unchanged next week?

EVIDENCE STANDARD

An SMC label is not a trade signal by itself; a trading method requires an instrument, a trigger, an invalidation, costs, a sampling plan and a repeatable review process.

Appendix D / Quick glossary

BOS Break of Structure; a trend-continuation break under the chosen structural rule.

CHoCH Change of Character; a countertrend structural change; precise rules vary.

MSS Market Structure Shift; a structural break, often paired with displacement.

IDM Inducement; a smaller swing/level interpreted as potential liquidity. Not universally defined.

BSL / SSL Buy-side / sell-side liquidity; hypotheses about stops above highs / below lows.

IRL / ERL Internal / external range liquidity; levels inside vs. outside a defined range.

FVG / iFVG Fair Value Gap / inversion FVG; a three-candle gap and its later invalidation/role change.

OB / BB / MB Order block / breaker block / mitigation block; educator-specific zone rules.

POI Point of Interest; a zone to monitor rather than an entry signal by itself.

STH/STL Short-term high/low; local pivot, commonly using a three-candle rule.

ITH/ITL Intermediate-term high/low; a hierarchy of short-term pivots.

EQ / P&D Equilibrium / premium-and-discount; midpoint and halves of a chosen range.

CISD Change in State of Delivery; candle-delivery confirmation in ICT-style teaching.

AMD / PO3 Accumulation, Manipulation, Distribution / Power of Three; a proposed price narrative.

OTE Optimal Trade Entry; commonly taught Fibonacci retracement zone around 62%-79%.

CRT Candle Range Theory; sweep and reclaim of an anchor candle's range; multiple variants.

QML Quasimodo Level; reversal sequence with higher-high/lower-low or mirrored structure.

QT Quarterly Theory; four-part time-cycle labels that require independent testing.

TBS / TWS / AO-X / CiC Terms appearing in the course list; obtain the instructor's definition before using them.
